

WHAT IS CLAIMED IS:

1. A method for identifying an end user computer connected to a data packet network to a called party connected to a public switched telephone network comprising the steps of:
 - 5 establishing a phone call between an end user terminal and a called party, the call being routed through a gateway connected to the data packet network and the public switched telephone network;
 - 10 locating an identifier on the end user computer, the identifier being associated with a user of the end user terminal, the identifier being present on the end user terminal prior to the establishing step;
 - 15 converting the identifier to an analog signal; and
 - transmitting the analog signal to the called party over the public switched telephone network.
2. The method of Claim 1, wherein the identifier is sent from the end user terminal to the gateway and is converted into an analog signal at the gateway.
3. The method of Claim 2, wherein the analog signal is transmitted according to an automatic number identification format.
4. The method of Claim 2, wherein the analog signal is transmitted according to a caller identification format.
- 20 5. The method of Claim 2, wherein the analog signal is transmitted according to a dialed number identification service format.
6. The method of Claim 2, wherein the analog signal is transmitted in the same manner as voice information.

7. The method of Claim 1, wherein the identification information is converted into a digitized packet at the end user terminal and the digitized packet is transmitted to the gateway by the end user terminal in the same manner as digitized voice data packets.

5 8. The method of Claim 1, further comprising the step of displaying data associated with the identifier on a display associated with the called party.

9. A method for identifying an end user terminal connected to a data packet network to a called party connected to a public switched telephone network comprising the steps of:

10 transmitting a web page to an end user terminal, the web page including a telephone call icon and an identifier associated with the end user terminal;

activating the icon at the end user terminal, the icon causing a telephone call to be established between the end user terminal and the called party through a gateway connected to the data packet network and the public switched telephone

15 network;

converting the identifier to an analog signal;

transmitting the analog signal to the called party over the public switched telephone network.

10. The method of Claim 9, wherein the identifier is sent from the end user computer to the gateway and is converted to an analog signal at the gateway.

20 11. The method of Claim 10, wherein the analog signal is transmitted according to an automatic number identification format.

12. The method of Claim 10, wherein the analog signal is transmitted according to a caller identification format.

13. The method of Claim 10, wherein the analog signal is transmitted according to a dialed number identification service format.

5 14. The method of Claim 10, wherein the analog signal is transmitted in the same manner as voice information.

15. The method of Claim 10, wherein the identification information is converted into a digitized packet at the end user terminal and the digitized packet is transmitted to the gateway by the end user terminal in the same manner as digitized
10 voice data packets.

16. The method of Claim 10, further comprising the step of displaying data associated with the identifier on a display associated with the called party.

17. The method of Claim 10, wherein the identifier is a session identification.

15 18. The method of Claim 10, wherein the identifier is a customer number.

19. The method of Claim 10, wherein the identifier is an icon identification.

20 20. A method for identifying an end user computer connected to a data packet network to called party equipment connected to a public switched telephone network comprising the steps of:
collecting, at the end user terminal, customer identification information;
transmitting the customer identification information to a first server;

(1)

storing the customer identification information at the first server;

establishing a phone call between an end user terminal and called party equipment, the call being routed through a gateway connected to the data packet network and the public switched telephone network;

5 detecting a gateway identifier at the called party equipment;

 sending the gateway identifier to the first server;

 using the gateway identifier to retrieve the customer identification information at the first server;

 sending the customer identification information from the first server to the

10 called party equipment.

 21. The method of Claim 19, wherein the customer identification information is collected from information included with an icon downloaded by the end user terminal from a second server.

 22. The method of Claim 21, wherein the information included with the icon is a session identification.

15 23. The method of Claim 21, wherein the information included with the icon is a customer number.

 24. The method of Claim 21, wherein the information included with the icon is an icon identification.

20 25. The method of Claim 19, wherein the gateway identifier is used to retrieve the customer identification information by retrieving the customer identification information associated with a most recent call established through the gateway corresponding to the gateway identifier.

26. The method of Claim 19, further comprising the steps of:
assigning, at the gateway, a gateway identifier to the call, the gateway
identifier being different from any other gateway identifier associated with any
other call being routed through the gateway during a duration of the call; and
5 maintaining a database of customer identification information which can be
indexed using the gateway identifier.

27. The method of Claim 19, wherein the gateway identifier is in a caller
identification format.

28. The method of Claim 19, wherein the gateway identifier is in a dialed
10 number identification service format.

29. A method for controlling a display of an end user terminal comprising
the steps of:

establishing a phone call between an end user terminal connected to a data
packet network and other party equipment connected to a public switched
15 telephone network, the phone call being routed through a gateway connected to the
data packet network and the public switched telephone network;

generating a dual tone multi-frequency (DTMF) command at the other party
equipment;

detecting the DTMF command;

20 forming an address based at least in part on the DTMF command;
receiving display information from the address at the end user terminal.

30. The method of Claim 29, wherein the DTMF command is detected at
the end user terminal in data packets received from the gateway.

31. The method of Claim 29, wherein the DTMF command is detected at the gateway, and the gateway sends a message including the DTMF command to the end user terminal.

32. The method of Claim 31, wherein the DTMF command detected at the 5 gateway is not sent in voice data packets.

33. The method of Claim 31, wherein the address is formed at the gateway.

34. The method of Claim 31, wherein the address is formed at a server in communication with the gateway and sent to the end user terminal.

35. The method of Claim 29, wherein the address is formed at the end user 10 terminal.

36. A method for exchanging information between an end user terminal and a second terminal associated with a called party comprising the steps of:

assigning a chatroom identifier to the called party;

establishing a phone call between an end user terminal connected to a data 15 packet network and other party equipment connected to a public switched telephone network, the phone call being routed through a gateway connected to the data packet network and the public switched telephone network;

generating a dual tone multi-frequency (DTMF) command corresponding to the chatroom identifier at the other party equipment;

20 detecting the DTMF command;

entering the chatroom at the end user terminal;

entering the chatroom at the second terminal; and

exchanging messages between the end user terminal and the second terminal.

37. The method of Claim 36, wherein the DTMF command is detected at the end user terminal.

5 38. The method of Claim 36, wherein the DTMF command is detected at the gateway.

39. The method of Claim 36, wherein at least one of the messages includes an address from which display information can be obtained and the end user terminal, upon receipt of such a message, obtains the display information from the address.

10 40. A method for exchanging information between an end user terminal and a second terminal associated with a called party comprising the steps of:

assigning an address corresponding to the second terminal to the called party, the address comprising a first portion and a second portion;

15 establishing a phone call between an end user terminal connected to a data packet network and other party equipment connected to a public switched telephone network, the phone call being routed through a gateway connected to the data packet network and the public switched telephone network;

storing the first portion of the address at the end user terminal;

20 generating a dual tone multi-frequency (DTMF) command at the other party equipment, the command comprising the second portion of the address assigned to the called party;

detecting the DTMF command;

forming the address at the end user terminal using the DTMF command and the first portion;

using the address to establish communications between the end user terminal and the second terminal.

5 41. The method of Claim 40, wherein the using step is performed by establishing a socket connection from the end user terminal to the second terminal at the address.

42. The method of Claim 40, wherein the DTMF command is detected at the gateway.

10 43. The method of Claim 40, wherein the DTMF command is detected at the end user terminal.

44. The method of Claim 40, wherein the first portion of the address is stored at the end user terminal along with software downloaded to the end user terminal and used to establish the phone call.
